

MASONRY

LOWERED BRICKWORK (with T profiles)

On the cantilever, like an edge of a slab, we have laid plates (120x100x10mm.), which are welded to T profiles 60.6. These T profiles hold up a UPN100 profile like a brickwork base. This brickwork is made of perforated brick, laid with cement mortar making the lowered.

The UPN's wings are like a water drip.

To let the T profiles to be remained into the brickwork; this brickwork has hollows on it.

Finally, to avoid exterior signals of the system, the joints are cladded with mortar and brick pieces. Then, the interior face is plastered.

The steel frame should be oxidation-protected before its placing.
