

SLOPED ROOFS

SLOPED ROOF WITH SANDWICH PANEL

These panels are formed by two lacquered strips, the exterior one is folded and the interior one is smooth; between them has been spread polyurethane foam as insulation. They are placed over metallic trusses, through mechanic anchors.

The panels are tongued and grooved and their upper strips are overlapping to finish off their joints. You can see the process of a hidden sheet gutter and insulation of glass wool; it is protected with a thin plate made of rubber.
