

## FLAT ROOFS

### NON TRAFFICABLE ROOF GARDEN

Over the sloping is extended an asphaltic primer and it is placed over the perimeter brick facing. Then, a reinforcement double layer bitumen elastomeric sheet is placed on the intersection between vertical plane and a horizontal plane. It's placed and polyester mesh welded to the primer, too.

Over the horizontal support, a waterproof membrane with fiberglass mesh is placed over the vertical brick facing.

The waterproofing is complete with a bitumen elastomeric sheet with a protective mineral coating.

As finishing of vertical sheets, a galvanized sheet is placed.

Before fill in with ground, a draining complex coat, and over the brickwork which make the sewer, it is placed a geotextile blanket to let the water flows.
